

## Magnetic Resonance Imaging (MRI) Scans

**Before**

**After**

Image shows MRI scans taken for one individual who lost 34% of visceral fat in the clinical study. The scans show before and after treatment (alli plus diet) for 3 months. Results may vary and the average visceral fat loss was 10%. Fat pixels corresponding to visceral fat have been coloured red, while fat pixels corresponding to subcutaneous fat have been coloured yellow. The dotted line indicates the waistline.
