

Before

After

**Before and After Photos of LATISSE® Clinical Trial Patient – Individual Results May Vary**

**Before Photo:** Eyelashes of patient at start of clinical trial.

**After Photo:** Increased eyelash prominence of patient at end of 16-week clinical trial.

The eyelashes displayed in these photos have not been retouched.

It is also possible for a difference in eyelash length, thickness, fullness, pigmentation, number of eyelash hairs, and/or direction of eyelash growth to occur between eyes. These differences, should they occur, will usually go away if you stop using **LATISSE®**.

**LATISSE®** solution is a prescription treatment for hypotrichosis used to grow eyelashes, making them longer, thicker and darker.

Eyelash hypotrichosis is another name for having inadequate or not enough eyelashes.

**Important Safety Information:**

If you are using, or have used, prescription products for any eye pressure problems, only use **LATISSE®** under close doctor care. Although not seen in **LATISSE®** clinical studies, may cause increased brown pigmentation of the colored part of the eye which is likely permanent. Eyelid skin darkening may occur which may be reversible. **Only apply at the base of the upper eyelashes. DO NOT APPLY** to the lower eyelid. Hair growth may occur in other skin areas that **LATISSE®** solution frequently touches. If you develop or experience any eye problems or have eye surgery, consult your doctor immediately about continued use of **LATISSE®**. The most common side effects after using **LATISSE®** solution are itchy eyes and/or eye redness. If discontinued, lashes will gradually return to their previous appearance.
