How Steril-Zone Works

The air flows through a three-stage purification zone that destroys allergens and pollutants to bring a whole new level of air cleaning.

1. Air enters through an air intake opening at the base of the unit.
2. The germicidal UVC Emitter™ kills viruses, bacteria, mold and other airborne microorganisms.
3. The extended life carbon filter removes VOCs and odors.
4. The high-efficiency particulate filter captures particulates from the air.
5. A commercial-grade fan moves the air at a rate of up to five changes per hour. A variable speed fan control allows the user to adjust fan speed as desired.
6. Clean air exits through the outflow vents and circulates through the room.

For further information, visit www.steril-zone.com.

Please see page 2 for details on Steril-Zone filter replacement.

Filter Replacement

Steril-Zone's three-stage air purification unit is concealed from view until it is time for replacement, typically after one year.

A service indicator light shows when it is time to replace the filter. The homeowner simply takes out the old filter unit and drops in the new one, replacing all three air cleaning components at once.

There are no tools needed, no washing of filters, and no complicated disassembly or servicing of separate components. For further information, go to www.steril-zone.com and click on "Filter Replacement Unit".

For further information, visit www.steril-zone.com.
